

Digitise your existing scoop control couplings

Fluidomat offers digitisation package for converting your existing couplings with switches to transmitters to digitise your couplings & keep pace with modern technological practices as per your requirement.

Digitisation offers several advantages in respect of:

- Integrating the fluid coupling operation with other systems.
- Continuous operation parameter monitoring with data logging & setting of temperature, Pressure & differential pressure levels in scoop coupling.
- It will provide continuous health status & will give pre indication / warning on requirement of maintenance/correction or impeding failures thus reducing costly downtime & failures.
- Improve decision making
- All operational parameters available on screen for monitoring thus avoiding need of physical presence on site which may be distantly located or on height.

Fluidomat offers digitisation system with complete package to digitise any scoop control / fill control fluid coupling compatible with DCS/PLC for continuous monitoring & control of fluid coupling in very cost effectively manner.
